

Non-Preemptive Priority Scheduling algorithm

Completed

Write a C program to implement the Non-Preemptive Priority Scheduling algorithm. The program should accept number of processes their Arrival Time (AT), Burst Time (BT), and Priority for each process. The process with the highest priority (lowest numerical value) must be executed first among those that have arrived. Calculate the Average Waiting Time and Average Turnaround Time.

Input Format

The first line contains an integer representing the number of processes.

The next lines contain three integers for each process, where

- The first integer denotes the Arrival Time (AT)
- The second integer denotes the Burst Time (BT)
- The third integer denotes the Priority of the process.

A lower numerical value indicates a higher priority.

Output Format

Select Language : C (GCC 9.2.0)

```

1 #include <stdio.h>
2 #include <stdbool.h>
3
4 struct Process {
5     int id;
6     int at;      // Arrival Time
7     int bt;      // Burst Time
8     int priority; // Priority (lower value = higher priority)
9     int ct;      // Completion Time
10    int tat;     // Turnaround Time
11    int wt;      // Waiting Time
12    bool isCompleted;
13 };
14
15 int main() {
16     int n;
17     printf("Enter number of processes: \n");
18     if (scanf("%d", &n) != 1) return 0;
19

```
