## FIFO Page Replacement Algorithm

Completed

Write a C program to implement the FIFO Page Replacement Algorithm. The program should take the number of frames and a reference string (sequence of page requests) as input. For each page in the reference string, determine if it results in a 'Page Hit' or a 'Page Fault'. Display the state of the frames after each request and calculate the total number of page faults and hits.

### Input Format

1. The first line of input contains an integer representing the number of pages in the reference string.
2. The second line contains the page reference string as a sequence of integers.
3. The third line contains an integer representing the number of available frames.

### Output Format

The total number of Page Faults and Page Hits are displayed

Select Language : C (GCC 9.2.0)

```
1 #include <stdio.h>
2 #include <stdbool.h>
3
4 int main() {
5     int n, capacity;
6
7     // Input for number of pages
8     printf("Enter number of pages in reference string\n");
9     if (scanf("%d", &n) != 1) return 0;
10
11     int pages[n];
12     printf("Enter the reference string: \n");
13     for (int i = 0; i < n; i++) {
14         scanf("%d", &pages[i]);
15     }
16
17     // Input for number of frames
18     printf("Enter number of frames: \n");
19     scanf("%d", &capacity);
20
21     int frames[capacity];
22     for (int i = 0; i < capacity; i++) {
23         frames[i] = -1; // Initialize frames with -1
24     }
25
26     int pageFaults = 0;
```
